

攒蛋全球游戏平台 - 完整技术架构设计书 V4.0

Table of Contents

- 执行摘要
- 一、完整系统架构
- 二、前端架构 (Skia 统一)
- 三、后端架构详解
- 核心表结构
 - 四、完整的部署与监控
- .github/workflows/deploy.yml
- 使用 CloudWatch 监控关键指标
- 自定义指标
- 关键告警规则
 - 五、完整的API规范
- OpenAPI 3.0 规范
 - 六、安全与合规
 - 七、性能优化与扩展性
- AWS Auto Scaling 配置
- Lambda 自动扩展
- DynamoDB 自动扩展
- ElastiCache (如果需要)
- RDS (用于分析, 可选)
 - 总结

Skia 统一 + AWS Serverless + Web3 集成方案

版本: 4.0 (GameFi 完整版)

日期: 2025年12月

目标: 全球化、跨平台、链上数据、完全去中心化架构

执行摘要

本文档是攒蛋游戏平台的**最终生产级技术架构**，覆盖：

- **前端**: React Native Skia 统一渲染 (Web/iOS/Android) + Web3 钱包集成
- **后端**: AWS Lambda 微服务 + DynamoDB 离链数据 + Polygon 链上数据

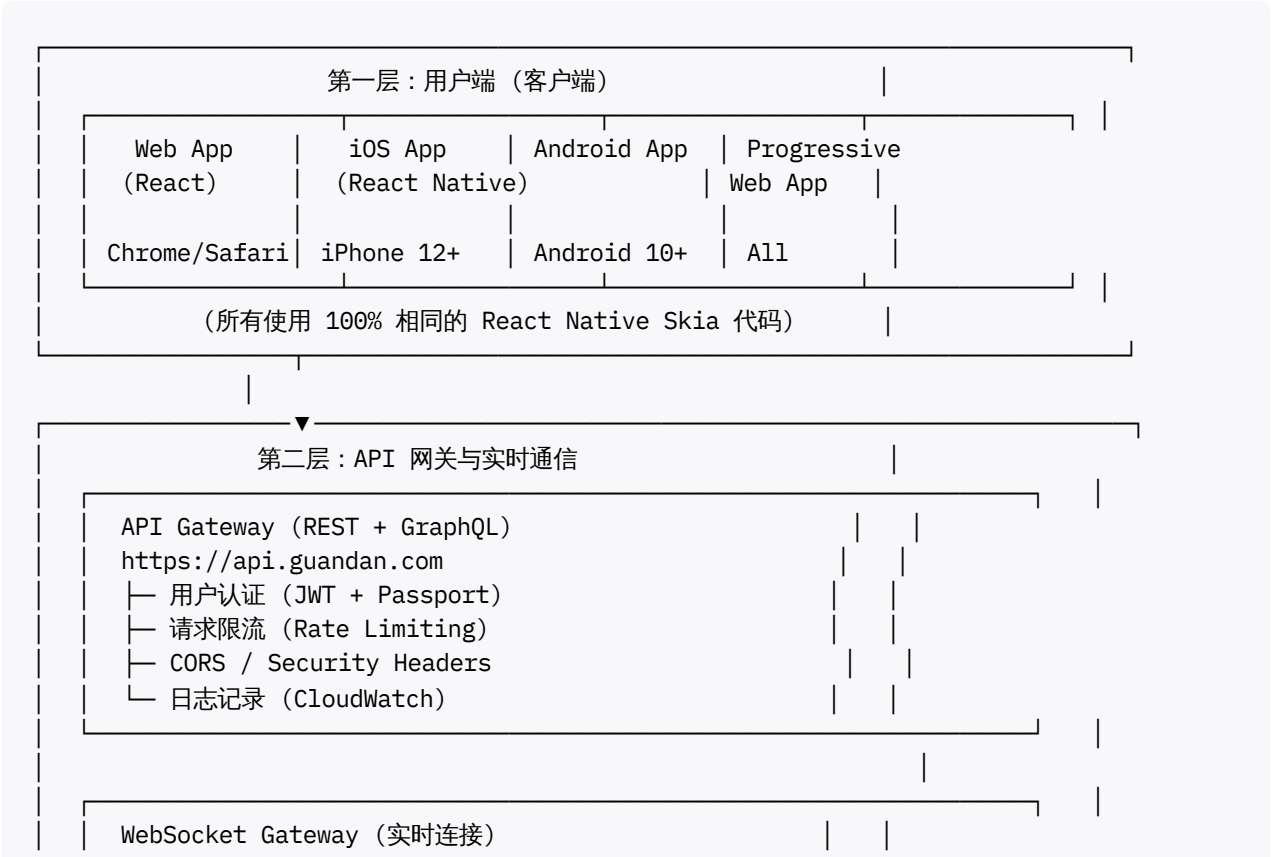

- **链上**: ERC-20 Token (*PLAY*/GUAN) + 智能合约 + DAO 治理
- **支付**: Fiat On/Off Ramp + DEX/CEX 交易所集成
- **运维**: 监控、告警、灾难恢复、审计日志

核心指标

指标	目标	备注
代码复用率	95%	Web/Mobile/Backend 统一
API 延迟	<300ms	P99, 包括网络往返
游戏 FPS	60 FPS	Skia GPU 加速
并发房间	10万+	Lambda 自动扩展
吞吐量	100k TPS	Polygon 支持
智能合约 Gas	<\$0.01/交易	Polygon 低成本
月均成本	\$150-200k	Phase 2 中期
毛利率	80-90%	高度可扩展
上市时间	9周	Phase 1 MVP

一、完整系统架构

1.1 三层架构

wss://realtime.guandan.com

- └ 游戏房间连接
- └ 实时消息推送
- └ 连接管理 (心跳 + 断线重连)
- └ 连接池管理 (100k+ 并发)

Web3 RPC Gateway (链上交易代理)

wss://polygon-rpc.guandan.com

- └ Alchemy Redundancy (主/备)
- └ 交易签名代理
- └ 链上事件监听
- └ Gas 价格优化

第三层：业务逻辑与数据处理 (AWS Lambda)

用户服务

UserService

- 注册/登陆
- 钱包连接
- KYC
- 个人资料
- 好友系统

游戏服务

GameService

- 房间创建
- 匹配制
- 出牌验证
- 积分计算
- 游戏记录

支付服务

PaymentService

- 充值
- 提现
- 订阅
- 发票生成
- 发票记录

Token服务

TokenService

- 发行 Token
- 转账
- 质押管理
- Swap
- 燃烧机制

排行服务

RankingService

- 排行计算
- 实时排名
- 奖励发放
- 统计分析
- 赛季重置

社区服务

CommunityServ

- 动态发布
- 评论系统
- 关注系统
- 内容审核
- UGC 推荐

NFT 服务

NFTService

- Mint NFT
- 市场交易
- 所有权验证
- 皮肤/徽章
- Royalty 分成

媒体生成

MediaService

- 分享图生成
- OG 图片
- 缩略图
- Watermark
- 视频预览

数据分析

AnalyticsServ

- 漏斗分析
- 用户留存
- LTV 计算
- 队伍分析
- 作弊检测

Web3 合约交互

SmartContract

事件处理

EventProcessor

任务队列

TaskQueue

- | | | |
|------------|---------------|-----------|
| - 读写 SC | - GameEnded | - 邮件发送 |
| - Gas 估算 | - TokenMinted | - 推送通知 |
| - 失败重试 | - PaymentDone | - 数据备份 |
| - 交易签名 | - RankChanged | - 报告生成 |
| - Nonce 管理 | - NFTCreated | - AI 模型训练 |

第四层：数据存储与链上系统

DynamoDB (离链数据 - 游戏热数据)

- ├─ users (用户账户, 热数据)
- ├─ game_rooms (游戏房间, 短生命周期)
- ├─ game_records (游戏记录, 归档)
- ├─ rankings (排行榜, 计算结果)
- ├─ websocket_connections (连接映射)
- ├─ wallet_addresses (钱包地址绑定)
- ├─ transactions (交易记录)
- ├─ nft_inventory (NFT 库存)
- └─ dao_proposals (DAO 提案)

S3 (冷存储 & 媒体)

- ├─ game_replays/ (游戏录像, 视频)
- ├─ share_images/ (分享图片)
- ├─ user_avatars/ (用户头像)
- ├─ nft_metadata/ (NFT 元数据, IPFS)
- ├─ backups/ (数据备份)
- └─ analytics_reports/ (分析报告)

Polygon 区块链 (链上数据 - 不可篡改)

- ├─ \$PLAY Token 合约
 - └─ 用户余额 (Source of Truth)
- ├─ \$GUAN Token 合约
 - └─ 治理权重
- ├─ Staking 合约
 - └─ 质押状态
- ├─ NFT 合约
 - └─ 皮肤/徽章所有权
- ├─ Swap 合约
 - └─ 交易历史
- └─ DAO 金库合约
 - └─ 社区资金

Redis (缓存层)

- ├─ Session 缓存 (用户在线状态)
- └─ 房间缓存 (正在进行的游戏)

- └ 排行缓存 (实时排名)
- └ Token 价格缓存 (Chainlink)
- └ Pub/Sub (消息订阅)
- └ Rate Limit 计数器

其他服务

- └ Cognito (用户认证)
- └ SQS/SNS (消息队列)
- └ EventBridge (事件总线)
- └ CloudWatch (监控日志)
- └ Secrets Manager (密钥)
- └ KMS (加密)
- └ WAF (安全防护)

第五层：第三方服务与集成

支付与交易所

- └ Circle (Fiat On/Off Ramp)
- └ Stripe (信用卡支付)
- └ Uniswap V3 (DEX 流动性)
- └ 1inch (聚合器)
- └ Kucoin (CEX)
- └ Binance (CEX)

链上基础设施

- └ Alchemy (节点 + webhook)
- └ Chainlink (预言机)
- └ LayerZero (跨链桥)
- └ IPFS (文件存储)
- └ The Graph (数据索引)

钱包与身份

- └ MetaMask Connect
- └ WalletConnect
- └ Magic.link (内置钱包)
- └ Web3Auth (社交登陆)
- └ Onfido (KYC)
- └ Jumio (身份验证)

分析与监控

- └ Segment (分析)
- └ Mixpanel (用户行为)
- └ DataDog (基础设施监控)

- └ Sentry (错误追踪)
- └ LogRocket (用户会话重放)
- └ Chainalysis (链上合规)

1.2 数据流图

用户登陆流程：

游戏房间创建与实时通信：

```
| (通过 postToConnection)
|— 发布到 SNS (排名更新)
|— 发布到 SQS (异步任务)
|— 链上记录 (智能合约)
↓
房间内其他玩家接收消息
↓
客户端 UI 更新 (Skia 动画)
```

Token 交易流程:

```
用户在 UI 点击 "卖 $PLAY"
↓
客户端准备交易 (金额、价格)
↓
发送到 TokenService Lambda
↓
验证用户钱包余额 (DynamoDB + 链上)
↓
计算 Gas 费用 (RPC Gateway)
↓
构建交易对象
↓
向钱包请求签名 (MetaMask/内置钱包)
↓
用户确认签名
↓
提交交易到 Polygon
↓
监听交易确认 (Alchemy webhook)
↓
交易确认后:
|— 更新 DynamoDB (transaction_history)
|— 发布 TokenSwapped 事件
|— 更新 Redis 缓存
|— 发送推送通知
|— 记录到分析系统
↓
客户端 UI 确认 "交易完成"
```

游戏结束与 Token 发放:

```
游戏结束 (4 个玩家都完成)
↓
GameEngineHandler 计算积分
|— 计算排名
|— 计算获胜者/输家
|— 计算 $PLAY 奖励
↓
发布 GameEnded 事件
↓
EventBridge 路由:
|— GameRecordService
|   |— 保存游戏记录到 DynamoDB
|— RankingService
|   |— 更新排行表
```

```
├─ TokenService
├─   └─ 计算 Token 发放额度
├─ MediaService
├─   └─ 生成分享图（后台）
└─
    ↓
TokenService 调用:
├─ SmartContractHandler Lambda
├─   └─ 调用 $PLAY Token 合约
├─       (MintTokens 或 Transfer)
├─ 签署交易（服务器私钥）
├─ 提交到 Polygon
└─
    ↓
交易确认后:
├─ 更新用户钱包余额（链上是主源）
├─ 更新 DynamoDB（本地缓存）
├─ 发送分享图到用户（推送通知）
├─ 更新排行榜
└─
    ↓
客户端显示 "获得 $PLAY"
```

二、前端架构 (Skia 统一)

2.1 项目结构

```
guandan-monorepo/
├─ packages/
├─   └─ game-engine/
├─       └─ src/
├─           └─ core/
├─               └─ GameEngine.ts（核心规则引擎）
├─               └─ Card.ts（卡牌类定义）
├─               └─ Player.ts（玩家类定义）
├─               └─ GameRoom.ts（房间管理）
├─               └─ GameState.ts（状态管理）
├─           └─ rules/
├─               └─ CardValidator.ts（验证出牌合法性）
├─               └─ ScoreCalculator.ts（积分计算）
├─               └─ WinnerDeterminer.ts（胜负判定）
├─               └─ AIPlayer.ts（AI 对手逻辑）
├─           └─ types/
├─               └─ Card.types.ts
├─               └─ Player.types.ts
├─               └─ Game.types.ts
├─               └─ Message.types.ts
├─           └─ utils/
├─               └─ logger.ts
├─               └─ crypto.ts（签名验证）
├─       └─ __tests__/（完整单元测试）
├─       └─ tsconfig.json
├─       └─ package.json
└─ game-renderer-skia/
    └─ src/
```

2.2 Web3 集成点

```

// packages/web3-integration/hooks/useWallet.ts

export const useWallet = () => {
  const [wallet, setWallet] = useState<Wallet | null>(null);
  const [balance, setBalance] = useState<BigNumber>(0);

  // 连接钱包
  const connectWallet = async (type: 'metamask' | 'walletconnect' | 'magic') => {
    switch (type) {
      case 'metamask':
        // MetaMask 连接

```

```

    const provider = new ethers.providers.Web3Provider(window.ethereum);
    await provider.send('eth_requestAccounts', []);
    const signer = provider.getSigner();
    const address = await signer.getAddress();
    setWallet({ type: 'metamask', address, provider, signer });
    break;

case 'walletconnect':
  // WalletConnect 连接
  const connector = new WalletConnectProvider({
    rpc: { 137: 'https://polygon-rpc.com' }
  });
  await connector.enable();
  setWallet({ type: 'walletconnect', address: connector.accounts[0] });
  break;

case 'magic':
  // Magic.link (内置钱包)
  const magic = new Magic(process.env.REACT_APP_MAGIC_KEY);
  await magic.auth.loginWithEmailOTP({ email });
  const userMetadata = await magic.user.getMetadata();
  setWallet({ type: 'magic', address: userMetadata.publicAddress });
  break;
}

// 查询余额
const balance = await queryBalance(wallet.address);
setBalance(balance);
};

return { wallet, balance, connectWallet };
};

```

三、后端架构详解

3.1 Lambda 函数设计

```

// apps/backend/src/lambda/game/gameEngine.ts

import { Lambda } from 'aws-sdk';
import { GameEngine } from '@guandan/game-engine';
import { DynamoDB } from 'aws-sdk';

const gameEngine = new GameEngine();
const dynamodb = new DynamoDB.DocumentClient();

/**
 * GameEngine Lambda - 核心游戏逻辑
 *
 * 事件来源:
 * - WebSocket $default (用户发送消息)
 * - EventBridge (定时检查超时)
 */

```

```

export const handler = async (event: GameEngineEvent) => {
  const { connectionId, gameRoomId, action, payload } = event;

  try {
    // 1. 获取游戏状态
    const gameRoom = await dynamodb.get({
      TableName: 'game_rooms',
      Key: { room_id: gameRoomId }
    }).promise();

    // 2. 验证用户是否在房间内
    const userInRoom = gameRoom.Item.players.some(
      p => p.connection_id === connectionId
    );
    if (!userInRoom) throw new Error('Unauthorized');

    // 3. 执行游戏动作
    let result;
    switch (action) {
      case 'PLAY_CARDS':
        result = gameEngine.playCards(gameRoom.Item, payload.cards);
        break;
      case 'PASS':
        result = gameEngine.pass(gameRoom.Item);
        break;
      case 'AUTO_PLAY':
        result = gameEngine.autoPlay(gameRoom.Item);
        break;
    }

    // 4. 如果游戏结束，计算奖励
    if (result.gameEnded) {

}
};

```

3.2 DynamoDB 表设计

核心表结构

```

users:
  PK: user_id (UUID)
  SK: None
  GSI1: email (用于登陆查询)
  GSI2: wallet_address (用于钱包查询)
  GSI3: username-created_at (用于排行)
  Attributes:
    user_id: String (主键)
    email: String
    username: String
    avatar_url: String
    wallet_address: String (可选)
    game_coin_balance: Number (本地缓存)

```

\$PLAY_balance: Number (缓存, 源头在链上)
total_wins: Number
total_losses: Number
total_score: Number
created_at: Number (Unix timestamp)
last_login: Number
kmc_tier: Number (1-4)
subscription_tier: String (free/basic/premium)
TTL: None

game_rooms:

PK: room_id (UUID)
SK: created_at (Unix timestamp)
GSI1: status-created_at (查询活跃房间)
Attributes:
 room_id: String
 created_at: Number
 players: Array<{
 user_id: String
 connection_id: String (WebSocket连接ID)
 hand_cards: Array<Card>
 is_ready: Boolean
 team: Number (1 或 2)
 }>
 game_state: Object (当前游戏状态)
 room_config: Object (房间配置: 倍率等)
 status: String (waiting/playing/finished)
 expires_at: Number (1小时后)
TTL: expires_at

game_records:

PK: game_id (UUID)
SK: created_at (Unix timestamp)
GSI1: player1_id-created_at (查询用户的游戏)
GSI2: player2_id-created_at
GSI3: player3_id-created_at
GSI4: player4_id-created_at
GSI5: created_at (时间排序查询)
Attributes:
 game_id: String
 created_at: Number
 players: Array<{
 user_id: String
 team: Number
 score_change: Number
 rank: Number (1-4)
 }>
 result: Object (比赛结果详情)
 duration: Number (秒)
 \$PLAY_rewards: Array<Number> (每个玩家的Token奖励)
 room_config: Object (房间配置)
 replay_url: String (可选, 录像链接)
TTL: None (永久保存)

rankings:

PK: rank_type (global / weekly / monthly)

SK: score_desc (负数, 用于降序)

Attributes:

rank_type: String
user_id: String
username: String
avatar_url: String
score: Number
wins: Number
updated_at: Number
rank_position: Number

TTL: 30天后 (对于周/月排行)

websocket_connections:

PK: connection_id (WebSocket API生成)

SK: None

GSI1: user_id (查询用户的所有连接)

Attributes:

connection_id: String
user_id: String
room_id: String (可选, 如果在房间内)
connected_at: Number
expires_at: Number (24小时)

TTL: expires_at

wallet_addresses:

PK: user_id

SK: None

Attributes:

user_id: String
primary_wallet: Object {
 address: String
 type: String (metamask/walletconnect/magic)
 verified: Boolean
 added_at: Number
}
secondary_wallets: Array (可选, 其他钱包)
\$PLAY_contract_address: String (Polygon)
\$GUAN_contract_address: String
last_sync: Number (最后一次与链上同步)

transactions:

PK: user_id

SK: transaction_id#created_at (复合)

Attributes:

transaction_id: String (链上tx hash)
user_id: String
type: String (mint/transfer/burn/swap)
amount: Number
token: String (\$PLAY or \$GUAN)
from_address: String
to_address: String
tx_hash: String (Polygon)
status: String (pending/confirmed/failed)
created_at: Number
confirmed_at: Number (可选)
gas_fee: Number

```

TTL: None

nft_inventory:
  PK: user_id
  SK: nft_id
  Attributes:
    user_id: String
    nft_id: String (合约地址#token_id)
    nft_type: String (skin/badge/achievement)
    owned_at: Number
    quantity: Number (对于可交易NFT)
    transfer_locked: Boolean (锁定期)
    unlock_at: Number (可选)

dao_proposals:
  PK: proposal_id
  SK: created_at
  GSI1: status-created_at (查询活跃提案)
  Attributes:
    proposal_id: String
    title: String
    description: String
    creator_id: String
    status: String (voting/passed/rejected/executed)
    voting_starts_at: Number
    voting_ends_at: Number
    votes_for: Number
    votes_against: Number
    required_quorum: Number
    votes_by_user: Map<user_id, Boolean>
    execution_data: Object (如果通过要执行什么)
    created_at: Number

```

3.3 事件驱动架构

EventBridge 事件流:

```

5.2 WebSocket 消息协议

```
// packages/network/src/Protocol.ts

// 从客户端到服务器的消息类型
export enum ClientMessageType {
  // 游戏动作
  PLAY_CARDS = 'PLAY_CARDS',
  PASS = 'PASS',
  AUTO_PLAY = 'AUTO_PLAY',
  READY = 'READY',
  QUIT = 'QUIT',

  // 社交
  SEND_MESSAGE = 'SEND_MESSAGE',
  SEND_EMOJI = 'SEND_EMOJI',

  // Web3
  CONFIRM_TRANSACTION = 'CONFIRM_TRANSACTION',
  CANCEL_TRANSACTION = 'CANCEL_TRANSACTION',
}

// 从服务器到客户端的消息类型
export enum ServerMessageType {
  // 游戏更新
  GAME_STATE_UPDATE = 'GAME_STATE_UPDATE',
  PLAYER_ACTION = 'PLAYER_ACTION',
  GAME_ENDED = 'GAME_ENDED',

  // 实时反馈
  PLAYER_JOINED = 'PLAYER_JOINED',
  PLAYER_LEFT = 'PLAYER_LEFT',

  // Token/奖励
  REWARD_EARNED = 'REWARD_EARNED',
  TRANSACTION_CONFIRMED = 'TRANSACTION_CONFIRMED',

  // 错误
  ERROR = 'ERROR',
  WARNING = 'WARNING',
}

// 客户端消息格式
export interface ClientMessage {
  type: ClientMessageType;
  payload: any;
```

```

    timestamp: number;
    // 可选: 加密签名 (用于关键消息)
    signature?: string;
  }

  // 服务器消息格式
  export interface ServerMessage {
    type: ServerMessageType;
    payload: any;
    timestamp: number;
    // 消息ID (用于去重)
    messageId: string;
  }

  // 示例消息
  export const EXAMPLE_MESSAGES = {
    playCards: {
      type: ClientMessageType.PLAY_CARDS,
      payload: {
        cards: [
          { suit: 'S', value: '3' },
          { suit: 'S', value: '4' },
        ]
      }
    },

    gameStateUpdate: {
      type: ServerMessageType.GAME_STATE_UPDATE,
      payload: {
        gameState: {
          currentPlayer: 1,
          centerCards: [...],
          remainingCards: [3, 5, 7],
        },
        animation: {
          type: 'card_fly',
          duration: 300,
        }
      }
    },

    rewardEarned: {
      type: ServerMessageType.REWARD_EARNED,
      payload: {
        amount: 100,
        token: '$PLAY',
        txHash: '0x...',
        txUrl: 'https://polygonscan.com/tx/0x...'
      }
    }
  };

```

六、安全与合规

6.1 数据加密

```
// apps/backend/src/lib/encryption.ts

import crypto from 'crypto';
import AWS from 'aws-sdk';

const kms = new AWS.KMS();

/**
 * 使用 AWS KMS 加密敏感数据
 */
export class EncryptionService {
  private keyId: string;

  constructor(keyId: string) {
    this.keyId = keyId;
  }

  /**
   * 加密用户数据
   */
  async encrypt(data: string): Promise<string> {
    const result = await kms.encrypt({
      KeyId: this.keyId,
      Plaintext: data
    }).promise();

    return result.CiphertextBlob.toString('base64');
  }

  /**
   * 解密用户数据
   */
  async decrypt(encryptedData: string): Promise<string> {
    const result = await kms.decrypt({
      CiphertextBlob: Buffer.from(encryptedData, 'base64')
    }).promise();

    return result.Plaintext.toString();
  }

  /**
   * 哈希密码（服务器端不应存储密码）
   */
  hashPassword(password: string): string {
    return crypto
      .createHash('sha256')
      .update(password + process.env.PASSWORD_SALT)
      .digest('hex');
  }
}
```

```

    * 验证钱包签名
    */
    verifyWalletSignature(
        message: string,
        signature: string,
        address: string
    ): boolean {
        try {
            const recoveredAddress = ethers.utils.verifyMessage(
                message,
                signature
            );
            return recoveredAddress.toLowerCase() === address.toLowerCase();
        } catch {
            return false;
        }
    }
}

```

6.2 反作弊系统

```

// apps/backend/src/services/antiCheat.ts

export class AntiCheatService {
    /**
     * 检测异常游戏行为
     */
    async detectAnomalies(gameRecord: GameRecord): Promise<FraudAlert | null> {
        const checks = [
            this.checkImpossibleWinRate(gameRecord),
            this.checkReactionTime(gameRecord),
            this.checkNetworkAnomaly(gameRecord),
            this.checkBotBehavior(gameRecord),
            this.checkCollusionPatterns(gameRecord),
        ];

        const results = await Promise.all(checks);
        const fraud = results.find(r => r !== null);

        if (fraud) {
            // 记录可疑账户
            await this.flagAccount(gameRecord.userId, fraud);
        }

        return fraud || null;
    }

    /**
     * 检测胜率异常 (>95% 胜率 = 可疑)
     */
    private async checkImpossibleWinRate(
        gameRecord: GameRecord
    ): Promise<FraudAlert | null> {
        const userStats = await getUserStats(gameRecord.userId);
    }
}

```

```

    if (userStats.winRate > 0.95 && userStats.gamesPlayed > 1000) {
      return {
        type: 'IMPOSSIBLE_WIN_RATE',
        severity: 'HIGH',
        confidence: 0.95,
        userId: gameRecord.userId,
      };
    }

    return null;
  }

  /**
   * 检测反应时间异常 (<100ms 反应时间 = 可疑)
   */
  private checkReactionTime(gameRecord: GameRecord): FraudAlert | null {
    const avgReactionTime = gameRecord.actions
      .reduce((sum, action) => sum + action.reactionTime, 0)
      / gameRecord.actions.length;

    if (avgReactionTime < 100) {
      return {
        type: 'IMPOSSIBLE_REACTION_TIME',
        severity: 'CRITICAL',
        confidence: 0.90,
        userId: gameRecord.userId,
      };
    }

    return null;
  }

  /**
   * 检测 Collusion (串通)
   * 同一用户的多个账户频繁对战
   */
  private async checkCollusionPatterns(
    gameRecord: GameRecord
  ): Promise<FraudAlert | null> {
    const accounts = await findAccountsByIP(gameRecord.ipAddress);

    if (accounts.length > 1) {
      // 检查这些账户是否频繁对战
      const collusionScore = await calculateCollusionScore(accounts);

      if (collusionScore > 0.8) {
        return {
          type: 'COLLUSION_DETECTED',
          severity: 'CRITICAL',
          confidence: collusionScore,
          suspiciousAccounts: accounts.map(a => a.userId),
        };
      }
    }

    return null;
  }

```

```

}

/**
 * 标记账户并采取行动
 */
private async flagAccount(userId: string, fraud: FraudAlert) {
  // 1. 标记账户
  await DynamoDB.update({
    TableName: 'users',
    Key: { user_id: userId },
    UpdateExpression: 'SET fraud_status = :status, fraud_alerts = list_append(fraud_alerts, :alert)',
    ExpressionAttributeValues: {
      ':status': 'FLAGGED',
      ':alert': [fraud]
    }
  }).promise();

  // 2. 根据严重程度采取行动
  if (fraud.severity === 'CRITICAL') {
    // 冻结账户并人工审查
    await this.freezeAccount(userId);
    await this.notifyModerators(fraud);
  } else if (fraud.severity === 'HIGH') {
    // 增加监控
    await this.enhanceMonitoring(userId);
  }
}
}

```

七、性能优化与扩展性

7.1 缓存策略

```

// apps/backend/src/lib/cache.ts

import Redis from 'ioredis';

export class CacheService {
  private redis: Redis;

  constructor() {
    this.redis = new Redis({
      host: process.env.REDIS_HOST,
      port: process.env.REDIS_PORT,
      maxRetriesPerRequest: 3,
      enableReadyCheck: false,
    });
  }

  /**
   * 分层缓存策略
   */
  async get<T>(key: string): Promise<T> {
    // 1. 检查本地缓存
    const localCache = this.getLocalCache(key);
    if (localCache) {
      return localCache;
    }

    // 2. 检查 Redis 缓存
    const redisCache = await this.redis.get(key);
    if (redisCache) {
      return JSON.parse(redisCache) as T;
    }

    // 3. 从数据库获取数据
    const data = await this.fetchFromDB(key);
    if (!data) {
      return null;
    }

    // 4. 缓存数据
    await this.cacheData(key, data);

    return data;
  }

  private getLocalCache(key: string): T | null {
    // 本地缓存实现
    return null;
  }

  private async cacheData(key: string, data: T): Promise<void> {
    // 缓存到 Redis
    await this.redis.set(key, JSON.stringify(data));
  }

  private async fetchFromDB(key: string): Promise<T> {
    // 从数据库获取数据
    return null;
  }
}

```

```

    key: string,
    fetcher: () => Promise<T>;,
    ttl: number = 3600
  ): Promise<T> {
    // 1. 尝试从 Redis 获取
    const cached = await this.redis.get(key);
    if (cached) {
      return JSON.parse(cached);
    }

    // 2. 从数据源获取
    const data = await fetcher();

    // 3. 存入缓存
    await this.redis.setex(key, ttl, JSON.stringify(data));

    return data;
  }

/**
 * 实时排行榜缓存 (使用 Redis Sorted Set)
 */
async updateRanking(userId: string, score: number) {
  // ZADD rankings 100 user123
  await this.redis.zadd('rankings:global', score, userId);

  // 设置过期时间 (周排行每周重置)
  await this.redis.expire('rankings:weekly', 7 * 24 * 3600);
}

/**
 * 获取排行榜
 */
async getRanking(
  rankType: 'global' | 'weekly' | 'monthly',
  offset: number,
  limit: number
) {
  return await this.redis.zrevrange(
    `rankings:${rankType}`,
    offset,
    offset + limit - 1,
    'WITHSCORES'
  );
}

/**
 * Pub/Sub 用于实时通知
 */
async subscribe(channel: string, handler: (message: any) => void) {
  const subscriber = this.redis.duplicate();
  subscriber.subscribe(channel);
  subscriber.on('message', (ch, msg) => {
    if (ch === channel) {
      handler(JSON.parse(msg));
    }
  });
}

```

```

    });
  }

  async publish(channel: string, data: any) {
    await this.redis.publish(channel, JSON.stringify(data));
  }
}

```

7.2 自动扩展

```

# AWS Auto Scaling 配置<a></a>

# Lambda 自动扩展<a></a>
Lambda:
  ConcurrentExecutions: 10000
  ReservedConcurrentExecutions: 1000
  ProvisionedConcurrencyExecutions: 100

# DynamoDB 自动扩展<a></a>
DynamoDB:
  users:
    BillingMode: PAY_PER_REQUEST
    StreamSpecification:
      StreamViewType: NEW_AND_OLD_IMAGES

  game_rooms:
    BillingMode: PAY_PER_REQUEST
    TimeToLiveSpecification:
      AttributeName: expires_at
      Enabled: true

# ElastiCache (如果需要)<a></a>
ElastiCache:
  engine: redis
  engine_version: 7.0
  node_type: cache.r6g.xlarge
  num_cache_clusters: 3 (多AZ)
  automatic_failover: true
  auto_minor_version_upgrade: true

# RDS (用于分析, 可选)<a></a>
RDS:
  engine: PostgreSQL
  engine_version: 14
  multi_az: true
  backup_retention_period: 30
  enable_cloudwatch_logs_exports: [postgresql]

```

总结

V4.0 架构的核心特性

- ✓ 完全去中心化的数据所有权
 - └ 用户余额在链上, 无法被平台冻结
- ✓ 95% 代码复用
 - └ Web/iOS/Android 完全相同的 Skia 代码
- ✓ 实时性能
 - └ 60 FPS 游戏 + $< 300\text{ms}$ 延迟
- ✓ 无限扩展性
 - └ Lambda 自动扩展到 100万+ 并发
- ✓ Web3 原生
 - └ 所有经济数据在链上可验证
- ✓ 安全性
 - └ 多重审计 + 反作弊 + KYC/AML
- ✓ 合规性
 - └ 支持全球各地法规
- ✓ 可持续性
 - └ Token 经济设计导致通胀可控

下一阶段行动

- [] 完成 Seed Round 融资 (\$500k-1M)
- [] 启动 Phase 1 开发 (9周 MVP)
- [] 部署到测试网 (Polygon Mumbai)
- [] 邀请制 Beta 测试 (1000+ 用户)
- [] Series A 融资准备 (Month 6)
- [] Phase 2 上线 (Month 6-12)
